LIQUID ORGANIC FERTILISER
CONTAINING AMINO ACIDS OF PLANT ORIGIN

Liquid organic fertilisers containing amino acids of vegetable origin are organic fertilisers used to increase the growth and yield of plants. Such fertilisers contain elements such as nitrogen (N), phosphorus (P), potassium (K), which are essential nutrients needed by plants and also provide plants with organic components such as amino acids.

Amino acids are important building blocks for plants and are used to build **proteins**.

Plants naturally take up nutrients from the soil or through foliage, but sometimes these nutrients may be lacking or if plants are under stress (e.g. due to drought or disease), additional nutrients and amino acids can give plants an extra boost.

Such fertilisers can be used to stimulate plant growth, increase flowering, support fruit formation and make plants more resistant to stress conditions. Organic fertilisers are more environmentally friendly than chemical fertilisers and can have a more positive effect on soil health.

Organic Matter	40 %
Organic Carbon	10 %
Organic Nitrogen (N)	3 %
Water Soluble Potassium Oxide (K ₂ O)	2 %
Free Amino Acid	16 %
pH	4-6
